

HUMANBOND

ETHGlobal Lisbon → Meridian → Stellar Community Fund

Strategy, Timing, Build Scope, Bounty Map & SCF Concept Brief

Prepared for the hackathon team, mentors & partners · ETHGlobal Lisbon, July 24–26, 2026

1 · The Strategy in One Page

The big picture: we already have a live product — HumanBond on World Chain Mainnet. This weekend we don't build a registry from scratch; we *upgrade our existing product* with decentralized identity (ENS) and decentralized storage (Walrus), then make it publicly verifiable (The Graph). That single distinction — existing product, not new build — is what qualifies us for ETHGlobal's **Continuity Track**, which is where our two cleanest prizes live.

The arc runs past the hackathon. Stellar is deliberately *not* in the Lisbon build — it's the settlement layer, a heavier non-EVM integration, and we've sequenced it to land at a specific launchpad: **Meridian, Stellar's annual developer conference, is in Lisbon in late October**. Leticia travels from Brazil to attend; Herb may speak. So the plan is: ship the EVM registry at ETHGlobal → immediately apply for a Stellar Community Fund (SCF) Build Award → build the Soroban settlement layer between now and late October → arrive at Meridian with it live or funded-and-in-flight.

Why this ordering wins: the ETHGlobal demo becomes the proof-of-concept the SCF grant funds. SCF's own rules (7.0) require your technical architecture to already be complete at application time — so a working, award-winning registry with a clean settlement seam is exactly what they want to fund. We turn a scope cut into a demonstrated roadmap with a named milestone, a funding path, and a stage.

THE ONE-LINE FRAME

“We take our live human-partnership registry, give every human and every bond an ENS identity that doubles as a payment address, move covenant data onto decentralized storage with Walrus, and make the whole registry publicly verifiable through The Graph — then extend it to Stellar settlement via an SCF grant, timed to Meridian.”

2 · The Architecture — Five Layers, One Job Each

Everything shipping at Lisbon is EVM-native on World Chain. No cross-chain bridging to debug at 3am — that's the point of this scope. Each layer does exactly one job and nothing is duplicated.

#	Layer / Protocol	Job — one thing only	Status	Owner
1	World Chain	Identity + mint. World ID gates it; HumanBond / VowNFT / MilestoneNFT contracts.	LIVE	Leticia
2	ENS (Durin)	Sub-IDs + payment address. name.humanbond.eth per human & per bond; the bond name = its receiving address.	BUILD	Leticia
3	Walrus (Sui)	Storage. Vows + NFT media as erasure-coded blobs; blob ID committed on-chain.	BUILD	Open
4	The Graph	Query + receipts. Subgraph indexes bond/vow/milestone/transfer events → read views & public verify.	BUILD	Franco
5	Stellar / Soroban	Treasury + settlement. TIME token, milestone settlement.	ROADMAP · OCT	Leticia

Design rule for the weekend: keep the treasury/settlement seam clean in the contracts — a clear interface where Soroban will plug in — so the October work is an *integration*, not a *retrofit*. That is the one architectural constraint the hackathon scope imposes on us.

3 · The Bounty Map — Where We Compete

Seven sponsor prizes are on the board. We are **not** chasing all of them. Scattershot loses; focus wins. Here is the honest read.

Register as Continuity Track

This is the unlock. Two of our best-fit prizes — ENS and Sui/Walrus — are **Continuity Track only**: for teams that already have a product and integrate/port during the weekend. HumanBond is live, so we qualify natively. Register Continuity Track on arrival.

Prize	Value	Verdict	Why
ENS (Continuity)	\$2,000	TARGET	Direct hit on our sub-ID layer. Booth demo Sun AM required, no hard-coded values.
Sui / Walrus (Continuity)	\$2,000	TARGET	Direct hit on storage. Chain-agnostic, slots into EVM. Reward depth: real before/after.
The Graph	(varies)	STRETCH	One-subgraph query does NOT qualify — needs composition/standard schema. Build simple subgraph anyway; reach only with spare cycles.
Hedera Agentic Pay	\$6,000	SKIP	Needs a live autonomous-payment agent. We have none this weekend. = roadmap Phase 3.
OG Best AI Product	\$6,000	SKIP	Needs live OG Compute inference product. = roadmap Phase 4.
Uniswap API	\$7,000	SKIP	Irrelevant to a partnership registry.

Anchor targets (build toward these)

- **ENS — \$2,000 (Continuity)**. Our sub-ID layer is a direct hit. **Hard requirement: functional demo with no hard-coded values, and we must present at the ENS booth in person on Sunday morning.** That's a logistics commitment — someone owns being at that booth.
- **Sui / Walrus — \$2,000 (Continuity)**. Our storage layer. They reward depth: a clear before/after with Walrus doing genuine work, not a bolt-on. Walrus is chain-agnostic and slots into our EVM app directly — exactly the “easiest first step off IPFS/S3” they describe.

Stretch target — read the fine print

THE GRAPH BOUNTY — TRADEOFF (team decides on the ground)

The catch: the Graph prize explicitly states that **simply querying one Subgraph does NOT qualify**. To win it you must either (a) compose two or more Graph products, or (b) build on a standardized schema (e.g. Messari Standardized Subgraphs) — and consume live data.

What that means for us: a basic HumanBond registry subgraph — which is all we actually need for the product — does NOT win this bounty as-scoped. Winning it requires extra scope that doesn't serve HumanBond directly (authoring a standardized schema, or composing a second Graph product like a Substreams module).

The call: build the simple subgraph regardless — we need it for the registry views and it strengthens the ENS + Walrus demos. Treat the Graph prize as a *stretch only if a spare builder has cycles Saturday night*. Do NOT trade ENS/Walrus polish for a Graph-composition gamble. Two clean Continuity wins beat one uncertain reach.

Traps — name them, don't chase them

- **Hedera Agentic Payments — \$6,000, and OG — \$6,000.** Tempting dollar amounts, but both require a working, demoable AI agent doing autonomous payments/inference (OG explicitly needs proof of OG Compute inference; a live product, not just a repo). We have **no Concierge agent this weekend**. Chasing these means building a throwaway agent instead of nailing the registry.
- **The silver lining:** these two map exactly onto our post-Stellar roadmap — x402/Hedera agentic payments and OG decentralized AI are Phases 3–4 of the Utility Concierge. So in the pitch they're not gaps; they're the funded future. We name them, we don't build them.
- **Uniswap — \$7,000.** Irrelevant to a partnership registry. Skip entirely.

4 · The Timeline

When	What
Jul 24–26 (Lisbon)	Ship 5 EVM layers. Register Continuity Track. Target ENS + Walrus awards. Draft SCF brief in parallel while the build is fresh.
Week of Jul 27	Submit the SCF interest form immediately (Build rounds run every 6 weeks; interest form → invite to submit). File the concept brief. Update it with actual ETHGlobal results.
Aug – Sep	Build the Soroban settlement layer against the clean seam left in the contracts. Hit Tranche 1 development milestones.
Late Oct (Meridian, Lisbon)	Arrive with Stellar layer live or funded-and-in-flight. Leticia attends from Brazil; Herb potentially speaking. Ecosystem presence supports the grant.

VERIFY IN HOUR ONE — three unknowns that can each break a layer

1. **Does Durin's factory support World Chain?** (It's OP-Stack — promising — but confirm. Fallback: demo on a supported OP-Stack testnet and note the port.)
2. **Does The Graph index World Chain?** (Confirm before promising the subgraph layer.)
3. **Confirm the exact ENS booth Sunday-morning presentation slot** and assign an owner to be physically there — it's a hard qualification requirement.

5 · Stellar Community Fund — Concept Brief

This is the draft to submit the week after ETHGlobal. Draft it *during* the hackathon while the build is fresh; the ETHGlobal demo IS the proof-of-concept.

Award	SCF Build Award — up to \$150,000 in XLM, paid in 4 milestone tranches.
Cadence	Build rounds every ~6 weeks. Submit the interest form ASAP to be invited into the current round (ref: SCF #43).
Tracks	Open · Integration · RFP. Integration is our likely fit.
Key rule	Architecture must be complete at application; Tranche 1 = development, not planning. Must end live on Stellar mainnet.
Applicant	Democracy Earth Foundation.
Verify	Confirm current round dates & Meridian 2026 dates before committing the timeline.

Project

HumanBond — a decentralized registry for two-person partnerships (marriages, co-founders, asset co-owners), anchored by proof of unique humanity. Applicant: **Democracy Earth Foundation** (co-founded by Santiago Siri; creators of Democracy OS and Proof of Humanity). Part of the TIME Protocol ecosystem.

Traction (why we clear the SCF bar)

- HumanBond is **live on World Chain Mainnet** — HumanBond, TIME Token, VowNFT and MilestoneNFT contracts deployed and verified; Mini App live in the World App store.
- At ETHGlobal Lisbon (July 2026) we extended the live product with ENS identity and Walrus decentralized storage, targeting the ENS and Sui Continuity awards. *[Update with actual results before submission.]*
- Backed by an established public-goods organization with standing across the human-rights, crypto and network-state ecosystems (HRF, Funding the Commons, OpenCivics).

What this grant funds

The **Soroban settlement & treasury layer** for HumanBond — the one layer deliberately scoped out of the EVM hackathon build. Specifically: migrate the TIME token treasury and bond settlement logic to Soroban, so bond milestones, TIME allocation and P2P value flows settle on Stellar with its low fees and fast finality, while World Chain retains identity/mint and ENS retains naming.

SCF 7.0 CONSTRAINT — write the application to match

SCF requires the technical architecture to be complete at application time, and Tranche 1 must be actual development — not planning or design. Our framing must be: **“the architecture is proven and live on World Chain; this grant funds the Soroban integration, which is already fully specified.”** Never “we’re figuring it out.”

Track

Integration Track is the strongest fit — we’re incorporating an existing ecosystem solution (Soroban settlement) into a live product. Open Track is the fallback if Integration criteria don’t line up. *Decision to confirm against the current SCF #43 track definitions before submitting.*

Budget & milestone structure (target: up to \$150,000 in XLM)

SCF Build pays in four milestone tranches (10% / 20% / 30% / 40%): first on acceptance, the rest on verified deliverables, ending in a functional project live on Stellar mainnet. Proposed shape:

Tranche	Share	Deliverable (illustrative — tie each to verifiable output)
#0	10%	On acceptance. Finalize Soroban contract spec + testnet scaffolding.
#1	20%	Soroban treasury + TIME token settlement contracts on Stellar testnet; unit-tested.
#2	30%	Bond milestone settlement + World Chain↔Stellar coordination live on testnet; Mini App wired to settlement.
#3	40%	Full settlement layer live on Stellar mainnet; end-to-end bond→settlement demo; docs + audit.

Note: budget must map to *future development* — not past work or general ops. Frame every line as “cost to complete deliverable X,” and present Leticia's in-person presence at Meridian as ecosystem engagement (SCF weights this).

6 · Talking Points — For Mentors & Partners

Read-aloud version. Keep it tight; let the live demo do the work.

THE PITCH (spoken)

“HumanBond is a decentralized registry for two-person partnerships — marriages, co-founders, asset co-owners — anchored by proof of unique humanity. It's already live on World Chain.

This weekend we shipped five layers, each doing one job: World ID proves each partner is a unique human; ENS gives each human and each bond a readable identity — `alice-bob.humanbond.eth` — that doubles as the bond's payment address; Walrus stores the couple's vows and NFT media as decentralized blobs; and The Graph makes the whole registry publicly verifiable, so anyone can confirm a bond without trusting our servers.

The architecture is decentralized end-to-end and modular by design — identity, naming, storage and query are each a purpose-built protocol, not a feature of our backend. On the roadmap: Stellar for settlement — which we're taking to Meridian in October via a Stellar Community Fund grant — then x402 agentic payments and OG decentralized compute, so the TIME Protocol Utility Concierge can pay for services and run its AI with no trusted server anywhere.”

If a mentor asks ...

- **“Why isn't Stellar in the demo?”** It's the settlement layer — a heavier non-EVM integration. We scoped it out deliberately to keep Lisbon a tight EVM build. It's our first roadmap item, going to Meridian in October via an SCF grant.
- **“What's real vs. vaporware?”** Live this weekend: the registry, ENS-named payment receipts, Walrus storage, public verification. Staged with dates: Stellar (Oct), then agentic payments + AI. We'll tell you exactly which is which.
- **“What's the AI/agent story?”** The Utility Concierge. It's roadmap — x402/Hedera for autonomous payments, OG for decentralized verifiable inference. Not built this weekend; deliberately staged so we ship the registry solid first.

One rule for the weekend: two clean Continuity wins (ENS + Walrus) beat seven half-finished reaches. Ship the registry. Name the roadmap. Take Stellar to Meridian.
